**Reference conditions**

Specifications in this document are valid at reference conditions derived by RTI for a typical X-ray tube and HF/DC generator. Unless otherwise stated, reference conditions are at SDD 100 cm, 100 mA and 100 ms. For R/F and dental specifications, X-ray tube with tungsten (W) target, 12° anode angle, and a total filtration of 3 mm Al equivalent. For mammography specifications, X-ray tube with tungsten (W) target, 16° anode angle, and a total filtration of 0.7 mm Al. For a parameter that is a part of the reference condition, only that parameter is changed when this specific parameter is expressed in specifications.

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor  $k = 2$ , which for a normal distribution corresponds to a coverage probability of approximately 95%. The standard uncertainty of measurement has been determined in accordance with EAL Publication EAL-R2.
